

Please find attached the revised version of the manuscript titled " _____ " for publication in National High School Journal of Science. We were delighted that the reviewer found our study of interest and thank them for their detailed and constructive advice on how to improve our paper. We have found their input incredibly helpful and really appreciate the level of feedback on our work. We believe that all of the points raised by the referees have been fully addressed in the revised manuscript. Below is a point by point response to the comments raised by the individual referees:

Major issues:

1. The title of the paper does not befit the content thereof. The content of the paper suggests that _____ is being appraised, reviewed and/or being compared relative to the traditional chemical analysis technique.
 - The title has been changed from “ _____ ” to “ _____ ”
2. The first 1 and 2 sentences of the abstract should be joined to form one sentence. There are also many cases like this in the main text that make reading difficult.
 - They have been joined together and we have reviewed the rest of the paper and clarified any noticeably complex sentences.
3. The abstract is supposed to give a summary of the paper in clear terms. In this case, it is not clear what the contribution of the paper is or what problems the authors are trying to solve.
 - We have described the paper’s importance in driving modern engineers and scientists towards implementing _____ at a larger scale to help make processes more sustainable.
4. There is lack of motivation in the paper, with no justification as to why this study should be pursued. For instance, **it is not clear to what extent _____ has been applied, and why further discussion might scale its use.** The fact that further adoption of _____ is sought implies that with the benefits, also come some shortcomings. These challenges of _____ should form premise to build the argument. Then, under each identified challenge, solution(s) should be proposed. All the solutions can be wrapped up to form a conclusion for the abstract. Mere detailing the advantages of _____ over _____ does not distinguish this paper from others available online. Unfortunately in this paper, only about 10 lines (refer to page 9) are dedicated to this. This is the main drawback why this paper cannot be published in this way.
 - The motivation has been outlined in the abstract, introduction, and conclusion.
 - Solutions to each drawback in the final section before the conclusion have been given, which were used to draw a conclusion in the end of the paragraph.
5. The 1st and 2nd sentences of the introduction are not linked properly. Also, in the last paragraph of the introduction, words like ‘we will’, etc. should be avoided. It is better to as, ‘ known methods in the literature are compared to introduce....’.
 - The first and second sentences of the introduction have been linked by extending the discussion of sustainability in the first sentence to the second one.

- We have also removed any phrases in the paper saying anything along the lines of “we will”.
6. The introduction is weak (with only two references cited) and does not convey the general thought of the study. For the paper to achieve its intended objectives, the authors should review relevant papers in the areas of _____ and _____. Juxtaposing the two techniques and if possible, provide real applications that actually show that ____ is a better option.
 - There are now more references in the first paragraph of the introduction. None have been added to the second paragraph, however, as there is no information given there besides a “list” of what will be discussed in the paper.
 - Real applications showing ____ as a better option have been outlined in the sub-section of _____ in section 3.
 - More relevant papers in the area of ____ have been referenced instead of online websites.
 7. The summary of the aim and objectives of study as stated at the end of the introduction are actually missing in the main content. No detailed mathematical concepts / formula was dedicated to ____ in the main text aside the chemical equation under each supposed benefit of _____.
 - We have modified the abstract and objectives to align more with the content of the paper. The end of the introduction has also been removed as its contents were not covered in the paper.
 - Four new mathematical equations have been added to model certain concepts.
 8. Since the authors are making comparison between ____ and _____, it is better to illustrate with the use of tables and/ or diagrams as appropriate.
 - A table has been added to model the difference between _____ and _____.
 9. From SECTION NAME to where we have SECTION NAME in the paper, there is lack of structure. It is not clear what the authors are trying to describe. There should be a heading, and sub-headings for each benefit.
 - The order of the sections has been rearranged and headings and subheadings have been added where needed.
 10. In each of the described benefits, it appears the authors only concentrate on giving general information. This should have been an avenue to detail specific benefits of ____ in relation to _____.
 - Subheadings have been added before every advantage to better structure the points.
 11. Ten non-peer reviewed article are referenced. This is too much for a paper with 31 references. Also, the content of the non-peer reviewed articles may not be scientifically correct.
 - There is now only one non-peer reviewed reference in the paper (which now contains 34 references).

Minor issues:

1. Heading and sub-heading numbers are missing from introduction to conclusion.
 - Headings and sub-heading numbers have been added from introduction to conclusion.
2. In line 6 under SECTION NAME, change ‘don’t’ to ‘do not’, also ‘couldn’t’ to ‘could not’ (line 10).
 - This has been modified to “do not” and “could not”.
3. In line 12 under _____, change ‘....can be achieve..’ to ‘...can be achieved..’
 - “...can be achieve...” has been changed to “...can be achieved...”.
4. On page 7 line 9, calibration and its definition is not necessary and should be removed.
 - Calibration and its definition have been removed.
5. On page 7 line 12, ‘...in UV...’ should be ‘...UV...’.
 - “...in UV...” has been changed to “...UV...”.
6. On page 7 line 17, the sentence starting from ‘This is another..’ is not clear and should be rephrased.
 - This sentence’s beginning has been changed to “This, too, exemplifies how the adoption of _____”.
7. Reference 10 ‘.._____?’ should be _____?’
 - This reference has been replaced with one from a paper that detailed the information in the text.
